Model 306 Slope Machine Control System

The **Laser-Tech Model 306 Slope Machine Control System** is an electronic device which keeps the blade either level or at the slope you have it set for coming or going. Any slope to plus or minus 100% can be set from the control panel. The slope can then be easily reversed at the touch of a button when you change direction. This system is perfect for scrapers, dozers and pavers.

Features:

- Adjustable slope settings of +/- 100%
- Blade control offers a proportional output speed control for both standard and proportional valves
- Blade correction speed increases as the error signal increases
- The slope is displayed in 10ths of a percent
- Compact size for easy mounting
- Can be controlled by external device such as GPS
- The override switch moves one side of the blade at full speed either up or down, disabling the "auto" function

Pair the **Laser-Tech Model 306 Slope System** with a **Laser-Tech Model 304 or Model 312 system** for both slope and elevation control at an affordable price.
